

A+ Data Security for Education

From K-12 schools to colleges and universities, educational institutions present highly attractive targets for cyberthreats because of the massive amounts of sensitive data they host.

PII, PHI, academic records, financial aid, payroll, alumni and research data proliferate across cloud and on-prem repositories. This data must be protected to ensure resilient learning and research environments, but therein lies the challenge. Many institutions don't know where their sensitive data is, nor can they keep track of who has access to the data and what they're doing with it.

Faculty, students, researchers, and administrative personnel—with varying access requirements—are logging in to student databases, payment systems, research repositories, email servers, and online learning platforms from diverse devices and locations.

And third-party providers like accreditation agencies and student loan services introduce yet another layer of risk. Every access point is a vulnerability, and without the right controls, data risks falls into the wrong hands.

This lack of visibility extends to public AI usage. Institutions can't see, or control, which AI tools their users are interacting with, or how their data is being shared with the tools, which increases the risk of sensitive data being leaked—and of being in violation of regulatory compliance requirements such as Family Educational Rights and Privacy Act (FERPA).

Risk, Redundancy, and Red Flags

Your risk report card isn't looking great.

Student PII is exposed in misconfigured databases, former faculty haven't had their access permissions revoked, and someone's uploaded proprietary research into AI tools. You've also got a whole lot of redundant data and a "never delete" mindset that's raising red flags on the compliance front.

Time to get your data governance grades up.

Key Benefits

Context-driven visibility into PII, PHI, academic records, financial data, and more

Full data discovery, labeling, and continuous monitoring across cloud and on-prem environments

Sensitive data prevented from being shared in AI tools

Anomalous data and user activity flagged

Duplicate and stale data records reconciled or deleted

Audits aced with quantifiable proof of compliance

End-to-End Data Governance Mastered

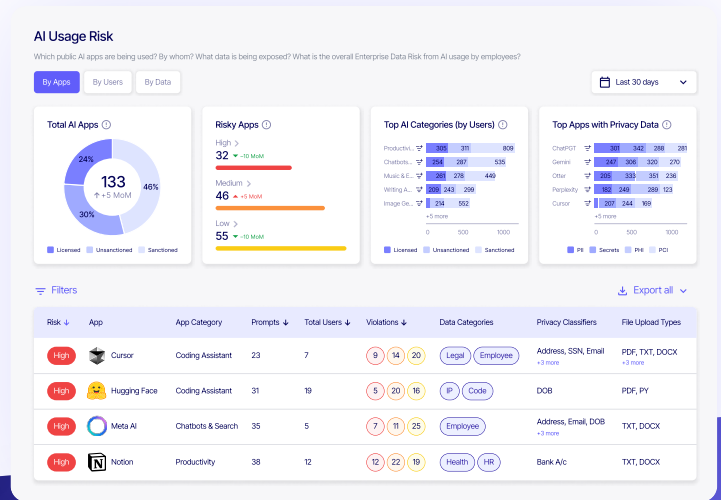

Concentric AI helps organizations across the education ecosystem protect data from risk by providing clear visibility into where their sensitive data resides and who has access to it.

The Semantic Intelligence™ AI and data security governance platform scans cloud and on-prem repositories at speed and at scale. It deploys fast with no agents or complex rules, immediately providing actionable, AI-driven insights.

Data is contextually discovered, classified, and continuously monitored for excessive permissions, risky sharing, unauthorized access, and more. The data lineage feature provides a full audit trail of access and usage—every view, edit, download, and share, while the user behavior data analytics feature detects abnormal user activity in relation to data. Once risks are identified, access policies can be set and autonomously enforced directly in the platform.

Because our AI understands context, we can easily discover duplicate and stale data. Automated retention policies are managed directly in the platform, and the built-in Compliance Dashboard provides clear insights into compliance with various frameworks.

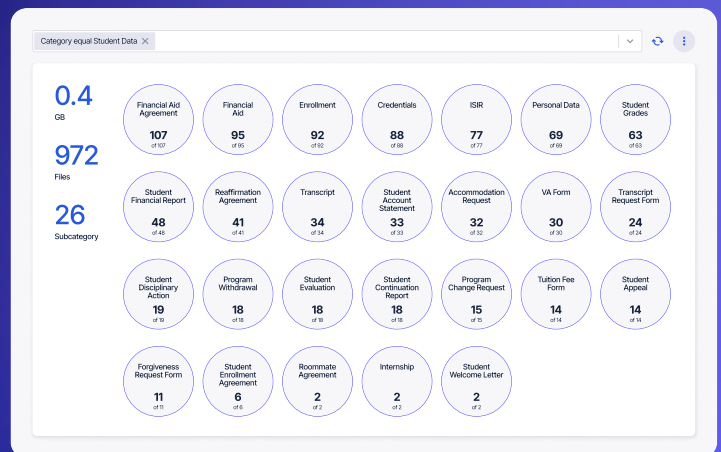

Concentric AI dynamically monitors and protects sensitive data across multiple AI use cases—AI assistants such as Microsoft Copilot, public AI tools such as ChatGPT, Claude, and Anthropic, and proprietary AI workloads. With Semantic DLP, any sensitive data being shared with public AI tools is blocked or redacted in real time.

From Data Disorder and Audit Fails to the Dean's List

Stop the guesswork and start acing your data security governance. No more cramming for regulatory compliance audits or late-night spiraling over data exposure scenarios.

Get the tools you need to crush your data security goals.

About Concentric AI

Concentric AI is intelligent data security made easy, delivering AI-powered governance that helps businesses protect sensitive data, reduce risk, strengthen compliance, and enable safe AI adoption.
